**BILATERAL TUBERCULOUS EPIDIDYMITIS PRESENTED AS A HUGE
SCROTAL MASS**

Yu-hung Lai, Chao-Yuan Huang, Jun Chen, Yeong-Shiau Pu

Department of Urology, National Taiwan University Hospital, Taipei, Taiwan, R.O.C.

Genitourinary tract tuberculosis is a specific chronic granulomatous infection. However, bilateral epididymal tuberculosis presented as a huge scrotal mass is uncommon. We report one case of bilateral epididymal tuberculosis which was noted three months after the prostate biopsy and was managed with unilateral simple epidymoorchiectomy.
